Phone: 301/436-5140

The National Poultry Improvement Plan became operative July 1, 1935, and the National Turkey Improvement Plan was started on September 25, 1943, with the approval of the Secretary of Agriculture. On December 3, 1971, the two Plans were combined under one title, "The National Poultry Improvement Plan," with separate provisions applicable to the different types of poultry.

The Plan operates under the authority of an appropriation made by Congress to the United States Department of Agriculture to be used in cooperation with the State authorities in the administration of regulations for the improvement of poultry, poultry products, and hatcheries. Authority for the administration of the Plan is now contained in the Department of Agriculture Organic Act of 1944, as amended (7 U.S.C. 429).

Provisions of the Plan are changed from time to time to conform with the development of the industry and with new information as it becomes available. These changes are based on recommendations made at the Biennial National Plan Conferences by official delegates representing participating breeders, hatcheries, and flockowners from all cooperating States. Current provisions of the Plan are described in a publication entitled "The National Poultry Improvement Plan and Auxiliary Provisions." The publication is available from Official State Agencies or on request to the National Poultry Improvement Plan, APHIS-VS, Room 848, Federal Building, Hyattsville, Maryland 20782.

The data contained in this publication are derived from information requested and obtained from the Contact Representatives in the 47 participating States. The data in these tables compares NPIP testing and participation information for the testing year July 1, 1986 thru June 30, 1987 with previous testing years.

National Poultry Improvement Plan--Tables on Hatchery and Flock Participation, 1985-86 and 1986-87, APHIS 91-43.

Published by the Animal and Plant Health Inspection Service-Veterinary Services, United States Department of Agriculture, Room 848, Federal Building, Hyattsville, Maryland 20782.

HIGHLIGHTS FOR TESTING YEAR 1986-87

"U.S. PULLORUM-TYPHOID CLEAN STATE"

Oklahoma became the 32rd State to obtain the status of a "U.S. Pullorum-Typhoid Clean State" under the National Poultry Improvement Plan (NPIP). States so classified have been recognized for their special effort in eliminating pullorum and fowl typhoid diseases from their poultry breeding flocks. These States are:

Alabama	Iowa	Missouri	Rhode Island
Arkansas	Kansas	Nebraska	South Carolina
Connecticut	Kentucky	New Hampshire	South Dakota
Delaware	Maine	North Carolina	Tennessee
Florida	Maryland	North Dakota	Texas
Georgia	Massachusetts	Ohio	Utah
Illinois	Minnesota	Oklahoma	Vermont
Indiana	Mississippi	Pennsylvania	Virginia

In addition, California, Colorado, Oregon, Washington, and Wisconsin have qualified for the classification "U.S. Pullorum-Typhoid Clean State, Turkeys."

"U.S. M. GALLISEPTICUM CLEAN STATE, TURKEYS"

Eight States are classified as "U.S. M. Gallisepticum Clean State, Turkeys" under the NPIP as of this testing year. These States are: Illinois, Indiana, Iowa, Minnesota, Nebraska, North Carolina, Virginia, and Wisconsin. These States have been recognized for their efforts in eliminating M. gallisepticum from their turkey breeding flocks.

HATCHERIES

Commercial chicken hatcheries participating in the NPIP reached an all-time high in hatching egg capacity (415.5 million) and an all-time low in numbers (392) this testing year. The hatcheries which produced "U.S. M. Gallisepticum Clean" chicks decreased slightly to 144, although their hatching egg capacity increased to 168.4 million. Those producing "U.S. M. Synoviae Clean" chicks increased in numbers (133) as well as capacity (159.3 million eggs). The number of turkey hatcheries remained the same (73), but their capacity decreased slightly to 29.8 million eggs. Over 98 percent of the capacity of these participating hatcheries produced "U.S. M. Gallisepticum Clean" poults while 58.8 percent produced poults classified as "U.S. M. Meleagridis Clean." In this, the second year of the "U.S. M. Synoviae Clean" program for turkeys, 58.4 percent of the hatching capacity produced poults of this classification. In the waterfowl, exhibition poultry, and game bird segment of the NPIP, 496 hatcheries, with a capacity of 8.1 million hatching eggs obtained "U.S. Pullorum-Typhoid Clean" status.

BREEDING FLOCKS

Egg-Type Chickens - A decrease occurred in the number of breeding flocks (781) and birds (4,111,306) classified as "U.S. Pullorum-Typhoid Clean," when compared with the significant increase last year. Although the number of flocks classified as "U.S. M. Gallisepticum Clean" and "U.S. M. Synoviae Clean" decreased this year, the proportion of both flocks and birds in the NPIP which were also classified under these two programs showed increases.

Meat-Type Chickens - Both the number of breeding flocks (2,935) and birds (32,656,549) classified as "U.S. Pullorum-Typhoid Clean" increased considerably over last year. An even more significant increase occurred in the number of flocks and birds which were classified as "U.S. M. Gallisepticum Clean" and "U.S. M. Synoviae Clean." Breeding birds participating in these two programs increased by over 55 percent and represented over 47 percent of all birds in the NPIP program.

Turkeys - Although there was a small increase in the number of breeding flocks (660), the number of breeding birds (3,917,589) classified as "U.S. Pullorum-Typhoid Clean" increased by nearly one-third. The number of turkeys classified as "U.S. M. Gallisepticum Clean" increased by 30 percent and represented 99.24 percent of all breeding turkeys in the NPIP. Nearly 70 percent of all turkeys in the program were also classified as "U.S. M. Meleagridis Clean." Breeding turkeys classified as "U.S. M. Synoviae Clean" totaled nearly 3 million and represented over 75 percent of all participating turkeys.

Waterfowl, Exhibition Poultry, and Game Birds - The 2,465 breeding flocks in this category which were classified as "U.S. Pullorum-Typhoid Clean" represented a decrease of nearly 20 percent from last year. However, the 555,918 birds so classified represented an increase of 13.6 percent. While there was a significant increase in both flocks and birds classified is "U.S. M. Gallisepticum Clean", the number represented a very small portion of the total which participated in the NPIP.

Pullorum Reactors - Just one of the 782 Egg-type breeding flock candidates tested positive for pullorum disease. This flock contained 502 birds. In the Waterfowl, Exhibition, and Game Bird candidate flocks, 18 of the 2,483 tested were positive for pullorum disease. These 18 flocks contained an average of 98 birds. No typhoid reactors have been found since 1980.

TABLE 1.--HATCHERY PARTICIPATION [1/]
IN THE NATIONAL POULTRY IMPROVEMENT PLAN
